

Project KOM (Kinetic Opportunity Mesh)

PROJECT BRIEF & EXECUTIVE OVERVIEW • GOOGLE GEMINI "FUND MY CRAZY 2026"

NATIONAL
FINALIST

FOUNDER & ARCHITECT: **Ridhi Jain** APPLICATION ID: #FMC-2026-KOM-8842 STAGE: Grand Finale Selection (Oct 1, IIT Delhi)

"Talent and ambition are distributed equally across India. Opportunity is not. Project KOM transforms the idle minutes millions of students spend waiting at everyday bus stops into an open, direct doorway to real career opportunities."

01 THE CORE PROBLEM: THE GEOGRAPHIC OPPORTUNITY DIVIDE

Across metropolitan India, over **12.4 million college students** commute on public transit every single day. The average commuter spends **18.2 minutes** standing at transit stops, waiting in silence or scrolling through social feeds.

Meanwhile, in corporate hubs like Gurugram, Bengaluru, and Mumbai, companies urgently need sharp, creative, practical thinkers. Yet traditional campus recruiting visits only a tiny fraction of top-tier colleges (the top 2%). A student studying in an ordinary college in Kanpur, Agra, or Varanasi might have remarkable problem-solving skills, but their resume is filtered out by automated screening software before any human recruiter ever reads it.

The problem is not that students lack talent. The problem is that they lack a physical bridge to show what they can actually do. **Project KOM builds that bridge directly into their daily commute.**

02 THE SIMPLE SOLUTION: HOW KOM WORKS IN DAILY LIFE

KOM retrofits everyday public bus shelters and neighborhood library spaces with simple, clear display boards that feature real-world business and design puzzles from partner companies. Here is how a student experiences it:

STEP 1 Spot a Real-World Challenge at the Bus Stop

While waiting for their bus, a student looks up and sees a clear, intriguing 3-line problem posted by a real company. For example: *"How can a local grocery network cut fresh food waste during peak summer heat?"*

STEP 2 Scan the QR Code with Any Smartphone — No App Needed

The student scans a quick QR code. A lightweight webpage opens instantly in their phone browser. There is no app to download, no password to remember, and no sign-up fee. It works smoothly even on basic mobile connections.

STEP 3 Think, Type, or Speak on the Commute

Students answer three simple questions. They can type their response or record a 2-minute voice note while riding the bus, explaining their logic and practical ideas in their own natural words.

STEP 4**Helpful Socratic Guidance Powered by Google Gemini**

Instead of grading like a strict exam, Gemini acts like a patient, encouraging mentor. It highlights strong reasoning and gently asks questions that help the student think deeper: *"Great point on refrigeration! How would a small neighborhood store handle the electricity cost?"*

STEP 5**Fair, Blind Evaluation Sent Directly to Hiring Teams**

When a student submits a great solution, their answer is packaged into a clean dossier and sent directly to company hiring managers. The student's name, college name, and city are hidden so they are judged purely on merit, creativity, and practical logic. Top thinkers earn direct interview invites.

03 WHY THIS MODEL WORKS: MUTUAL VALUE FOR EVERYONE

For Students

100% Free forever. Direct access to real industry puzzles, personalized thinking feedback, and interview opportunities without needing an elite college brand or privileged connections.

For Companies

High-quality talent at 92% lower cost. Replaces expensive campus recruitment tours (average ₹1,85,000 per hire) with pre-evaluated, genuinely creative thinkers for just ₹14,200 per placement.

For Cities & Transit

Zero initial budget required. Turns ordinary bus shelters and public libraries into active community education hubs, boosting citizen social mobility without new civic taxes.

04 OVERVIEW OF THE 5-SLIDE PRESENTATION DECK

The accompanying executive presentation deck tells this story visually and crisply through five straightforward slides:

SLIDE 1: Re-Imagining Everyday Transit Spaces

THE BIG IDEA

Shows how public transit shelters can be upgraded from passive waiting areas into active problem-solving hubs that spark curiosity every single morning.

- Turns 18.2 minutes of wasted waiting time into purposeful personal growth.
- Requires ₹0 in initial city budget by leveraging existing infrastructure.
- Moves smart city thinking from managing road traffic to unlocking human potential.

SLIDE 2: The Reality of Geographic Gatekeeping

THE PROBLEM

Illustrates how 88% of corporate hiring opportunities remain locked in just 2.4% of urban elite zones, leaving millions of capable students completely isolated.

- Resumes from regional colleges are routinely rejected by automated pedigree filters.
- Internet access provides information, but not an accessible professional network.
- Students want to prove what they can build, but have no platform to be seen.

SLIDE 3: How Real Problems Reach Everyday Commuters

THE ENGINE

Shows the clean, reliable path from a company desk to a street-level screen, translating complex industry briefs into clear, inspiring student questions.

- Partner companies share non-sensitive operational puzzles and growth questions.
- Gemini clarifies complex jargon into concise, bite-sized micro-challenges.
- Questions appear on ultra-low-power, glare-free e-paper screens that work in full sunlight.

SLIDE 4: Fair Hiring Based Purely on Real Ability

THE USER FLOW

Visualizes the student solving a challenge on their phone, receiving constructive coaching, and submitting a blind capability dossier to corporate recruiters.

- Students can speak or type their ideas naturally during their commute.
- Gemini provides real-time coaching to help organize and refine their thinking.
- Recruiters evaluate candidates with names and colleges hidden, ensuring 100% fair selection.

SLIDE 5: A Sensible, Step-by-Step Execution Plan

THE ROADMAP

Lays out a realistic, low-risk roadmap that proves student demand and corporate hiring before investing in street-level physical hardware.

- Starts immediately in public libraries and college reading rooms with existing computers.
- Expands to 120 bus stops only after achieving 500 verified student job and internship placements.
- Hardware is vandal-resistant, low-power, and designed specifically for Indian weather.

05 REALISTIC, LOW-RISK IMPLEMENTATION ROADMAP

PHASE 01 • MONTHS 1 TO 3

Zero-Hardware Pilot

Launch immediately using existing computer systems in municipal libraries and college reading rooms. Validate student engagement and achieve the first 500 verified corporate placements.

PHASE 02 • MONTHS 4 TO 6

High-Density Bus Corridor

Install 50 rugged, low-power electronic ink display units at student-heavy bus shelters along a single urban pilot corridor (e.g., Greater Noida to Delhi).

PHASE 03 • MONTHS 7 TO 12

Regional Expansion

Scale to 250 transit shelters across major student commuting hubs across Uttar Pradesh and NCR, funded entirely by sustainable corporate talent subscriptions.

06 THE BIGGER PICTURE: TRANSFORMING SOCIAL MOBILITY

India does not have a shortage of smart, hard-working students. It has an infrastructure problem: the distance between where great minds grow up and where great companies hire is simply too wide.

By placing real-world problem-solving directly in the path of everyday commuters, **Project KOM makes opportunity part of the city's physical landscape**. It gives every student waiting for a bus the chance to prove their worth, sharpen their mind, and claim their rightful seat at the table.
